

AmeriNet, Inc.
Making electronic debit simple.™

“Outsourcing the interface design to CTR allowed our people to stay focused on our core business.”

David Kerlin, CEO
AmeriNet, Inc.
Lake Oswego, OR

Rapid integration of Internet check processing secures big customer

One of the Internet's top four e-commerce sites wanted use AmeriNet's debit-it™ solution within 90 days. However, a software interface was needed. CTR designed and implemented a Component Object Model (COM) interface to the debit-it™ transaction server within the 90-day framework.

Situation

AmeriNet, Inc., is a Portland-based provider of electronic debit processing. Its debit-it™ service allows on-line shoppers to pay Internet vendors from their checking accounts electronically.

Critical issues

One of the Internet's top four e-commerce sites wanted to use AmeriNet's debit-it™ solution to replace its manual, paper check payment system and it stipulated that the new system be in place within 90 days. However, a software interface between the company's existing systems and the debit-it™ product was needed and, according to David Kerlin, AmeriNet CEO, “We couldn't write one in that time without taking resources from other important projects. We needed the assistance of a systems integrator to meet our client's conversion schedule.” AmeriNet turned to CTR.

Solution

After determining requirements, CTR designed a Component Object Model (COM) interface to AmeriNet's debit-it™ transaction server. The component was built with Microsoft Visual Basic 6.0 Enterprise Edition and tested in Portland. It was then delivered to AmeriNet's e-commerce client and, after a few hours of training and orientation, the client was able to integrate and deploy the debit-it™ solution.

Technology

Microsoft Visual Basic 6.0, Enterprise Edition

Results

Use of the new interface enabled AmeriNet's client to integrate debit-it™ service into its existing systems in the required time. Instead of waiting for checks to be mailed, opened, credited and deposited — a process that took more than a week — AmeriNet's client now receives payments instantly.

The new interface will also facilitate the implementation of future debit-it™ integration projects. "And," Kerlin says, "by outsourcing the interface to CTR, we were able to avoid re-directing about 160 hours of internal resource time. That's time our people could stay focused on our core business."
